Money Hub: architecture

A customer reaches ARIA by phone, chat or the Money Hub page; ARIA hands the conversation to the Strands Money Hub agent on AgentCore through Connect's A2A collaboration.

Contact path 1 a call or chat starts the bot flow · 2 the injector puts the verified customer and their products in ARIA's session · 3–4 Lex hands every turn to ARIA · 5 for Money Hub questions ARIA hands over to the collaborator (needs the collaborators security profile) · 6 Connect calls the bridge with the API key · 7 the bridge checks it · 8 the bridge calls the Strands agent with IAM, binding the customer Connect verified · 9 the agent works out every figure with its tools and answers with Claude; it hands back to ARIA with COMPLETE or ESCALATE.

Page path A the page calls its API with the link's secret · B the API starts a chat or web call in the bot flow, verified only if the link came from a Level 2 conversation · C the browser chats over the Participant Service · D or talks over the Chime SDK · E during a call, the API reads the turns from ARIA's Q in Connect session for the live transcript.
